Installing stride from source

In order to install stride on a Unix/Linux system with gcc follow these steps. Other compilers need slight modifications of the Makefile.

1. Download the stride stand-alone program [source code](#)
2. Create a directory wherever/stride and copy the tar ball there
3. Unpack the tar ball: `tar -zxvf stride.tar.gz`
4. Compile stride: `make`
5. Now you have a binary file stride in your directory, you can copy it to `/usr/local/bin` or add the current directory to your path to use it system-wide
